## CONCLUSIONS

Development of a LED-based goniophotometric hyperspectral imaging system for the analysis of automotive paintings.

Good colorimetric performance and similar to that of the BYK-mac® and the X-Rite MA98®.

Future work: Minimization of the colour differences when dealing with pearlescent pigments and development of texture descriptors.

## ACKNOWLEDGEMENTS

This research was supported by the Spanish Ministry for Economy and Competitiveness through the Project DPI2011-30090-C02. Francisco J. Burgos would also thank the government of Catalonia for the PhD grant received.
